

# From crystals to cellularity of wKLRW algebras

Or: From path to strings

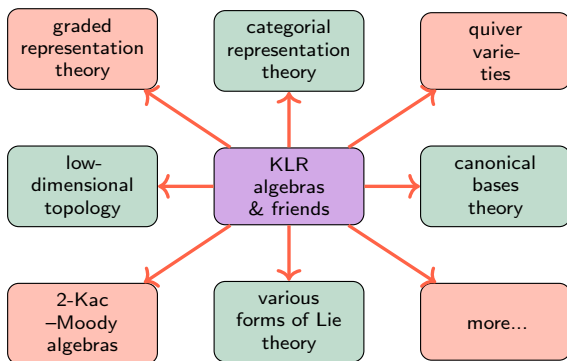

Daniel Tubbenhauer

Joint with Andrew Mathas

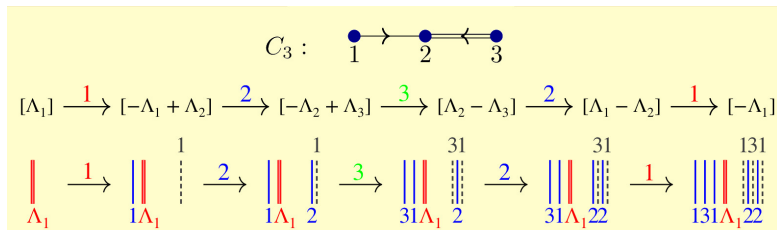

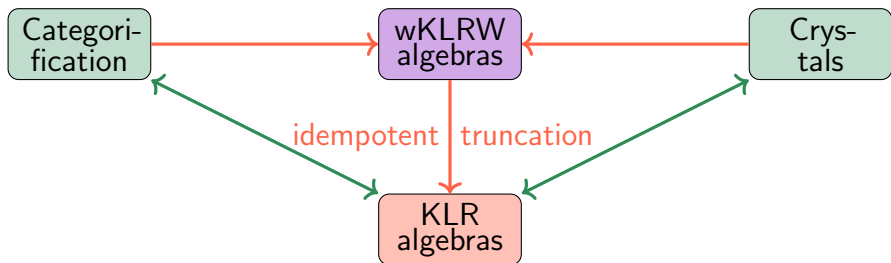

December 2022

# What? Why? How?

- ▶ **Khovanov–Lauda–Rouquier ~2008 + many others** (including many people here) KLR algebras are at the heart of categorical representation theory
- ▶ **Problem** These are actually really complicated!
- ▶ **Goal** Try to find nice (“cellular”) bases for them

# What? Why? How?

Use a richer combinatorics which is somewhat easier although more sophisticated

In a **60 minute talk** I would tell you about

beautiful diagrammatics , powerful abstract nonsense and partnership :

1) The diagram combinatorics beautiful

2) Sandwich cellularity powerful

3) Idempotents and crystals partners

Categori-  
fication

In a **30 minute talk** I will tell you about  
partnership :

Crys-  
tals

## 3) Idempotents and crystals partners

$$C_3: \quad \bullet \xrightarrow{1} \bullet \xleftarrow{3} \bullet$$

1            2            3

$$[\Lambda_1] \xrightarrow{1} [-\Lambda_1 + \Lambda_2] \xrightarrow{2} [-\Lambda_2 + \Lambda_3] \xrightarrow{3} [\Lambda_2 - \Lambda_3] \xrightarrow{2} [\Lambda_1 - \Lambda_2] \xrightarrow{1} [-\Lambda_1]$$

$$\begin{array}{c} | \\ \Lambda_1 \end{array} \xrightarrow{1} \begin{array}{c} | \\ | \\ \Lambda_1 \end{array} \xrightarrow{2} \begin{array}{c} | \\ | \\ | \\ \Lambda_1 \end{array} \xrightarrow{3} \begin{array}{c} | \\ | \\ | \\ | \\ \Lambda_1 \end{array} \xrightarrow{2} \begin{array}{c} | \\ | \\ | \\ | \\ | \\ \Lambda_1 \end{array} \xrightarrow{1} \begin{array}{c} | \\ | \\ | \\ | \\ | \\ | \\ \Lambda_1 \end{array}$$

1            2            31            31            131

$$[\Lambda_1] \xrightarrow{1} [-\Lambda_1]$$

$$\begin{array}{c} | \\ \Lambda_1 \end{array} \xrightarrow{1} \begin{array}{c} | \\ | \\ \Lambda_1 \end{array}$$

$$\begin{array}{c} | \\ | \\ | \\ | \\ \Lambda_1 \end{array} \xrightarrow{1} [-\Lambda_1]$$

$$\begin{array}{c} | \\ | \\ | \\ | \\ | \\ | \\ \Lambda_1 \end{array} \xrightarrow{1} \begin{array}{c} | \\ | \\ | \\ | \\ | \\ | \\ | \\ \Lambda_1 \end{array}$$

131

Use a richer combinatorics which is somewhat easier although more sophisticated

## Reps at $q = 0$

---

$$\begin{array}{c} [\Lambda_1] \\ \downarrow 1 \\ [-\Lambda_1 + \Lambda_2] \\ \downarrow 2 \\ A_4: [-\Lambda_2 + \Lambda_3] \\ \downarrow 3 \\ [-\Lambda_3 + \Lambda_4] \\ \downarrow 4 \\ [-\Lambda_4] \end{array}$$

- ▶ In this talk,  $\mathfrak{g}$  is some Kac–Moody algebra with Chevalley generators  $e_i, f_i$
- ▶ In essence, a crystal is a directed graph with colored edges, and it is the combinatorial shadow of a  $\mathfrak{g}$ -rep

vertices  $\longleftrightarrow$  weight spaces

colored edges  $\longleftrightarrow$  action of the  $f_i$

## Reps at $q = 0$

- ▶ **Example (above)** The simple  $\mathfrak{sl}_2$ -rep  $\text{Sym}^4 \mathbb{C}^2$  via the **vanilla**, **tableaux**, **PBW flavor**
- ▶ **Crystal magic** Get rid of all funny coefficients and summands, and only keep the “main part” of  $\mathfrak{g}$ -reps

## Reps at $q = 0$

$$\begin{array}{c}
 [\Lambda_1] \\
 \downarrow 1 \\
 [-\Lambda_1 + \Lambda_2] \\
 \downarrow 2 \\
 A_4: [-\Lambda_2 + \Lambda_3] \\
 \downarrow 3 \\
 [-\Lambda_3 + \Lambda_4] \\
 \downarrow 4 \\
 [-\Lambda_4]
 \end{array}
 \quad \text{or} \quad
 \begin{array}{c}
 \boxed{1} \\
 \downarrow 1 \\
 \boxed{2} \\
 \downarrow 2 \\
 \boxed{3} \\
 \downarrow 3 \\
 \boxed{4} \\
 \downarrow 4 \\
 \boxed{5}
 \end{array}
 \quad \text{or} \quad
 \begin{array}{c}
 1 \\
 \downarrow 1 \\
 f_{\alpha_1} \\
 \downarrow 2 \\
 f_{\alpha_1 + \alpha_2} \\
 \downarrow 3 \\
 f_{\alpha_1 + \alpha_2 + \alpha_3} \\
 \downarrow 4 \\
 f_{\alpha_1 + \alpha_2 + \alpha_3 + \alpha_4}
 \end{array}$$

- ▶ **Example (above)** The simple  $\mathfrak{sl}_5$ -rep  $\mathbb{C}^5$  via the **vanilla**, **tableaux**, **PBW flavor**
- ▶ **Crystal magic** Get rid of all funny coefficients and summands, and only keep the “main part” of  $\mathfrak{g}$ -reps

# Reps at $q = 0$

$$A_4 \rightsquigarrow SL_5(\mathbb{C})$$

$$B_4 \rightsquigarrow SO_9(\mathbb{C})$$

$$C_4 \rightsquigarrow SP_8(\mathbb{C})$$

$$D_4 \rightsquigarrow SO_8(\mathbb{C})$$

- ▶ **Example (above)** The simple reps  $L(\Lambda_1)$  of classical types
- ▶ **Crystal magic** Get rid of all funny coefficients and summands, and only keep the “main part” of  $\mathfrak{g}$ -reps

Reps at  $q = 1$

Crystals come in many flavors:

Vanilla Works in general

Tableaux Works for classical types ABCD

PBW Works for finite types

The point Any flavor has different combinatorics

$A_4$

$B_4$

$C_4$

$D_4$

► Example

► Crystal magic Get rid of all funny coefficients and summands, and only keep the “main part” of  $g$ -reps

Reps at  $q =$

Idea

The combinatorics of crystals determines algebraic properties of KLR/wKLRW algebras and vice versa

They might look different but are actually the “same”

▶ Example

▶ Crystal

the “main part” of  $\mathfrak{g}$ -reps

and only keep

# Reps at $q = 0$

Let us enjoy some crystals in type  $A_2$ :

# Reps at $q = 0$

$q = 0$   
of the  
PBW theorem:

- ▶ In **finite type** one can cut out all crystals from a general PBW crystal
- ▶ **Idea** If the partnership between crystals and KLR algebras works, then finite type KLR algebra should be quite special

## Placing strings: crystals and KLR (of level one – for convenience only)

---

- ▶ We now play a string placing game
- ▶ Only certain “good” configurations give nice tones
- ▶ The “good” configurations come from paths in crystal graphs

## Placing strings: crystals and KLR (of level one – for convenience only)

- ▶ Strings come in three types, **solid**, **ghost** and **red**

$$\text{solid : } \begin{array}{c} | \\ i \end{array}, \quad \text{ghost : } \begin{array}{c} \vdots \\ i \end{array}, \quad \text{red : } \begin{array}{c} || \\ i \end{array},$$

- ▶ Strings are labeled by simple roots, and solid and ghost strings can carry dots
- ▶ Red strings anchor the diagram ( $\#$  red strings  $\leftrightarrow$  level)
- ▶ Otherwise no difference to symmetric group diagrams
- ▶ Get wKLRW diagrams: **“solid string =  $f_i$ , red strings = highest weight”**

Placing

wKLRW algebras are string diagram algebras associated to a quiver with the point being the presence or absence of Reidemeister moves

That means that sometimes strings get blocked

# Placing strings: crystals and KLR (of level one – for convenience only)

- ▶ The highest weight of the crystal tells you the **starting position** i.e. the red string placement
- ▶ Fix a path and move along it, while doing so place strings so that they are **blocked by the previous string**
- ▶ This produced an idempotent  $1_\Lambda$  associated to a crystal  $\Lambda$

# Placing strings: crystals and KLR (of level one – for convenience only)

# Placing strings: crystals and KLR (of level one – for convenience only)

In finite types the PBW theorem for crystals implies that:

- ▶ For a fixed choice of path per vertex  $1_\Lambda$  gives rise to a cell module with an associated simple
- ▶ All simples arise in this way
- ▶ Simples for different vertices are not equivalent

# Placing strings: crystals and KLR (of level one – for convenience only)

$$C_3 : \quad \bullet \xrightarrow{1} \bullet \xleftarrow{2} \bullet$$

$$[\Lambda_1] \xrightarrow{1} [-\Lambda_1 + \Lambda_2] \xrightarrow{2} [-\Lambda_2 + \Lambda_3] \xrightarrow{3} [\Lambda_2 - \Lambda_3] \xrightarrow{2} [\Lambda_1 - \Lambda_2] \xrightarrow{1} [-\Lambda_1]$$

This was  
the thumbnail

LOEBLICH 2024

From crystals to cellularity of wKLRW algebras

Dr. From paths to strings

December 2022

1/5

A beefed-up version (stated for completeness) is:

Paths in crystals give sandwich cellular bases

$$\begin{aligned}
 \mathbb{K}\mathcal{L}_\lambda &\cong \mathbb{K}T(\lambda) \otimes_{\mathbb{K}} \mathcal{H}_\lambda \iff \begin{array}{c} T \\ | \\ m \\ | \\ B \end{array}, & \mathbb{K}\mathcal{R}_\lambda &\cong \mathcal{H}_\lambda \otimes_{\mathbb{K}} \mathbb{K}B(\lambda) \iff \begin{array}{c} T \\ | \\ m \\ | \\ B \end{array}, \\
 \mathcal{J}_\lambda &\cong \mathbb{K}T(\lambda) \otimes_{\mathbb{K}} \mathcal{H}_\lambda \otimes_{\mathbb{K}} \mathbb{K}B(\lambda) \iff \begin{array}{c} T \\ | \\ m \\ | \\ B \end{array}, & \mathbb{K}\mathcal{H}_\lambda &\cong \mathcal{H}_\lambda \iff \begin{array}{c} T \\ | \\ m \\ | \\ B \end{array}.
 \end{aligned}$$

This works in all finite types but also beyond

Conversely if the crystals do not satisfy certain properties then cellularity fails

What? Why? How?

- Khovanov–Lauda–Rouquier – 2008 + many others (including many people here) KLR algebras are at the heart of categorical representation theory
- **Problem** These are actually really complicated!
- **Goal** Try to find nice ("cellular") bases for them

These slides in category of wKLRW algebras Dec 2022 5/5

Reps at  $q = 0$

- **Example (above)** The simple reps  $L(\Lambda_i)$  of classical types
- **Crystal magic**: Get rid of all funny coefficients and summands, and only keep the "main part" of  $q$ -reps

These slides in category of wKLRW algebras Dec 2022 5/5

Placing strings: crystals and KLR (of level one – for convenience only)

- We now play a **string placing game**
