Es kommt daraus den Übergang der Verwickelung  
 so als Aggregat von Teilen anzustellen daß  
 man nicht welche Teile einander abstrahirt.

Wahrscheinlich sind es gerade die halben Umwicklungen  
 einer Linie um die andere nach einem bestimmten Drehungs-  
 Sinn anzugeben.  
 In diesem Beispiel  
 ab, ab, ab, ab

Man braucht nur in jeder Linie zu zählen wie oft + und - wechselt

H

- ▶ **Braid groups** have been around for Donkey's years
- ▶ It took a while until braid got formalized; e.g. **Artin ~1925**
- ▶ What makes them so **tantalizing** is that they are in the intersection of topology and algebra, and difficult and easy at **the same time**

```
1 B = BraidGroup(3)
2 b = B([1, 2, 1])
3 b.LKB_matrix(variables='q,t')
4 [          0 -q^4*t + q^3*t          -q^4*t]
5 [          0          -q^3*t          0]
6 [      -q^2*t  q^3*t - q^2*t          0]
7 c = B([2, 1, 2])
8 c.LKB_matrix(variables='q,t')
9 [          0 -q^4*t + q^3*t          -q^4*t]
10 [          0          -q^3*t          0]
11 [      -q^2*t  q^3*t - q^2*t          0]
```

► **Laurence–Krammer–Bigelow (LKB) ~ 2001** Braid groups are linear

► I.e. there is a way to associate matrices  $M(\beta)$  to braids  $\beta$  such that

$$\beta = \gamma \Leftrightarrow M(\beta) = M(\gamma)$$

## Braids and repre

This is pretty darn awesome!

This solves the recognition problem of braids, e.g.

which we can check in SageMath:

Type some Sage code below and press Evaluate.

```
1 B=BraidGroup(3)
2 b=B([2,-1,-1,-1,2,1,1,1])
3 Bb=b.LKB_matrix()
4 c=B([1,2,2,1,2,1,2,1])
5 Bc=c.LKB_matrix()
6 Bb==Bc
```

Evaluate

False

SageMath

$$\begin{bmatrix} -q^4*t \\ 0 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} -q^4*t \\ 0 \\ 0 \end{bmatrix}$$

► Laurence–K

► I.e. there is a

ps are linear

uch that

Weyl ~1946:

- 
- ▶ **Howe** ~ **1989++** Schur–Weyl duality approach to classical invariant theory
  - ▶ Howe took Weyl's, quote, “wonderful and terrible book” on classical invariant theory and reformulated it in terms of double centralizers

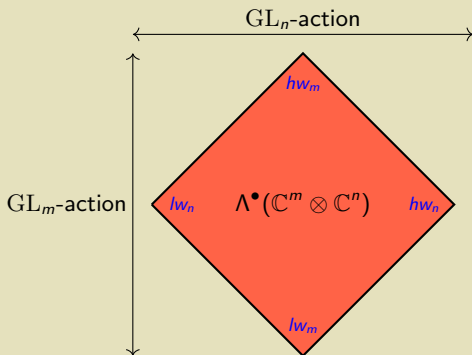

Example **Howe** ~1989

There are two commuting actions on the exterior algebra

$$GL_m \curvearrowright \Lambda^\bullet(\mathbb{C}^m \otimes \mathbb{C}^n) \curvearrowleft GL_n$$

that generate each other's centralizer, i.e.

$CGL_m \rightarrow \text{End}_{GL_n}(\Lambda^\bullet(\mathbb{C}^m \otimes \mathbb{C}^n))$  and vice versa with picture:

► Howe

► Howe

invariant theory and reformulated it in terms of double centralizers

ariant theory

sical

Example **Howe** ~1989 continued

**Adamovich–Rybnikov** ~1996 argued that this version of Howe duality is tilting theory  
We won't need this  
but this essential means that you can tilt your head and things look the same

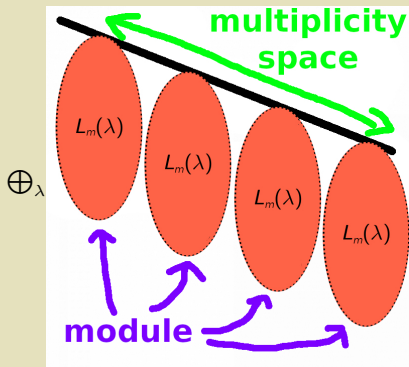

- ▶ Howe took Weyl's, quote, "wonderful and terrible book" on classical invariant theory and reformulated it in terms of double centralizers

## Braids and representations

### Example Howe ~1989 continued

Howe showed even more: the copies of the simple  $GL_m$ -module  $L_m(\lambda)$  appearing in  $\Lambda^\bullet(\mathbb{C}^m \otimes \mathbb{C}^n)$  form a  $GL_n$ -module  $L_n(\lambda^T)$  and vice versa with picture:

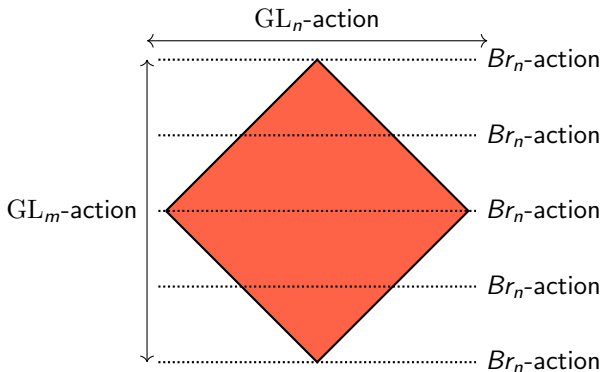

$GL_m$ - $GL_n$ -bimodule decomposition  $\Lambda^\bullet(\mathbb{C}^m \otimes \mathbb{C}^n) \cong \bigoplus_{\lambda} L_n(\lambda) \otimes L_m(\lambda^T)$

invariant theory and reformulated it in terms of double centralizers

## Braids and representations

---

- 
- ▶ Let us focus on  $GL_m$ - $GL_n$  dualities
  - ▶ Example **Howe** ~1989 continued Every  $GL_m$ -weight space carries an action of the  $n$ -strand braid group  $Br_n$  Braid reps

## Upshot

We get many  $Br_n$ -reps  
and they are related to  $GL_m$ -combinatorics

- ▶ Let us focus on  $GL_m$ - $GL_n$  dualities
- ▶ Example **Howe** ~1989 continued Every  $GL_m$ -weight space carries an action of the  $n$ -strand braid group  $Br_n$  Braid reps

Upshot

We get many  $Br_n$ -reps  
and they are related to  $GL_m$ -combinatorics

Tasks

Find the LKB rep in Howe's setting  
Use  $GL_m$ -combinatorics to study them

► Let us

► Example

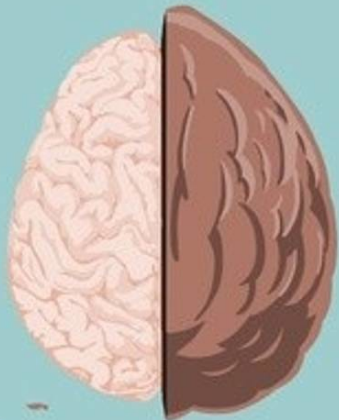

of the

is an action

$GL_n$ -action

Howe's approach in a nutshell

**Commuting actions**  
**Double centralizer**  
**Bimodule decomposition**  
**Braids act on weight spaces**

of the  $n$ -strand braid group  $Br_n$  Braid reps

## Where does the LKB representation come from?

---

```
1 B = BraidGroup(3)
2 b = B([1])
3 b.LKB_matrix(variables='q,t')
4 [ -q2*t      0  q2 - q ]
5 [           0      0      q ]
6 [           0      1  -q + 1 ]
```

- ▶ The LKB rep has two variables  $q, t$
- ▶ It is easy to guess that  $q$  is a quantum group parameter
- ▶ But what is  $t$ ?

## Where does the LKB representation come from?

1

B

Disclaimer

2

b

The  $q$  is crucial but harmless and I will ignore it, i.e.  $q = 1$ !

3

b.LKB matrix(variables='q,t')

4

[  ~~$-q^2 t$~~   $0$   ~~$q^2$~~   $q$  ]  $0$

5

[  ~~$t$~~   $0$   $0$   ~~$q$~~  ]  $1$

6

[  $0$   $1$   ~~$-q + 1$~~  ]  $0$

- ▶ The LKB rep has two variables  $q, t$
- ▶ It is easy to guess that  $q$  is a quantum group parameter
- ▶ But what is  $t$ ?

## Where does the LKB representation come from?

$\mathbb{C} =$  indexing set for simples

- ▶ **Verma+Bernstein–Gelfand–Gelfand** ~1966++ there exists a category  $\mathcal{O}$  of  $\mathfrak{sl}_2(\mathbb{C})$ -modules whose simple objects  $L(t)$  are indexed by  $t \in \mathbb{C}$
- ▶ There is a similar statement for other semisimple Lie algebras

# Where does the LKB representation come from?

$\mathbb{C} =$  indexing set for simples

**Weyl (and others) ~1930++** classified finite dimensional simple  $\mathfrak{sl}_2(\mathbb{C})$ -modules which are indexed by  $\mathbb{N}_0$

Natural numbers

$\mathcal{O}$  fills in the remaining complex numbers

► Verm  
of  $\mathfrak{sl}_2$

category  $\mathcal{O}$

► There is a similar statement for other semisimple Lie algebras

## Where does the LKB representation come from?

$E$  moves to the right,  $F$  moves to the left,  $H$  is a loop.

- ▶ For  $t \notin \mathbb{N}$  the simples are so-called **Verma modules**  $\Delta(t)$
- ▶ These are **free modules** where  $E = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$  and  $F = \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix}$  act freely up to a highest weight condition
- ▶  $H = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$  acts **diagonally**

## Where does the LKB representation come from?

---

**Liouville's Constant**  
– *The earliest transcendental number* –

$$L = \sum_{n=1}^{\infty} \frac{1}{10^{n!}} = 0.110001000\dots$$

In[2]:=

**1 + Pi + Pi ^ 2**

Out[2]=

**1 +  $\pi$  +  $\pi^2$**

- 
- ▶ **Folklore** ~??? Transcendental numbers are essentially **variables**
  - ▶ Mathematica for example treats  $\pi$  as a **variable** unless specified otherwise
  - ▶ Hence, why not take  **$\Delta(t)$**  for  $t$  transcendental?

## Where does the LKB representation come from?

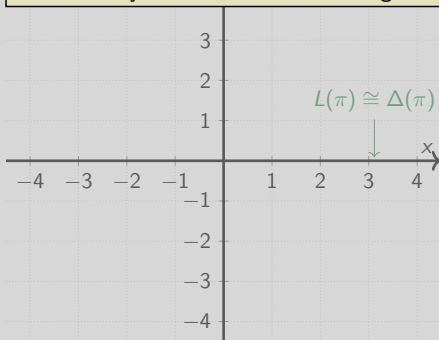

$\mathbb{C} =$  indexing set for simples

- ▶ **Jackson–Kerler** ~2009 The LKB rep of  $Br_n$  can be constructed using  $\Delta(t)^{\otimes n}$  for transcendental  $t \in \mathbb{C}$
- ▶ This is a **Reshetikhin–Turaev type construction** (different from the original)

## Jackson–Kerler ~2009

The construction of the LKB rep involves only  $R$ -matrices and nothing fancy!

- ▶ **Jackson–Kerler ~2009** The LKB rep of  $B_{r_n}$  can be constructed using  $\Delta(t)^{\otimes n}$  for transcendental  $t \in \mathbb{C}$
- ▶ This is a Reshetikhin–Turaev type construction (different from the original)

**Jackson–Kerler ~2009**

The construction of the LKB rep involves only  $R$ -matrices and nothing fancy!

3

**Kåhrström (and others) ~2007**

The tensor product  $\Delta(t)^{\otimes n}$  naturally lives in  $\tilde{\mathcal{O}}$

$\tilde{\mathcal{O}} = \mathcal{O}$  but allow countable direct sums

The tensor product is  $\infty$  semisimple

Example  $\Delta(t)^{\otimes 2} \cong \bigoplus_{s \in \mathbb{N}} \Delta(2t - 2s)$

-4

- ▶ **Jackson–Kerler ~2009** The LKB rep of  $Br_n$  can be constructed using

$\Delta(t)^{\otimes n}$  for transcendental  $t \in \mathbb{C}$

- ▶ This is a Reshetikhin–Turaev type construction (different from the original)

### Jackson–Kerler ~2009

The construction of the LKB rep involves only  $R$ -matrices and nothing fancy!

3

### Kåhrström (and others) ~2007

The tensor product  $\Delta(t)^{\otimes n}$  naturally lives in  $\tilde{\mathcal{O}}$

$\tilde{\mathcal{O}} = \mathcal{O}$  but allow countable direct sums

The tensor product is  $\infty$  semisimple

Example  $\Delta(t)^{\otimes 2} \cong \bigoplus_{s \in \mathbb{N}} \Delta(2t - 2s)$

-4

Ignore the tilde:

the point is that the LKB rep

comes from semisimple classical Lie theory

(plus very standard quantization)

► Jackson–Kerler

$\Delta(t)^{\otimes n}$  for tr

constructed using

► This is a Reshetikhin–Turaev type construction (different from the original)

## Where does the LKB representation come from?

- **Jackson–Kerler** ~2009 The  $(l \in \mathbb{N})$ th LKB rep  $LKB^{n,l}$  of  $Br_n$  is

$$LKB^{n,l} = \ker(E) \cap \ker(H - (nt - 2l))$$

- **Examples**  $l = 0 \iff$  trivial,  $l = 1 \iff$  red. Burau,  $l = 2 \iff$  LKB

# Verma Howe duality

► **Dense** modules of  $\mathfrak{sl}_n(\mathbb{C}) = \text{weight} + \text{support equals a coset from } \mathfrak{h}^*/Q$

► The above are examples of **dense  $\mathfrak{sl}_2(\mathbb{C})$ -module**

# Verma Howe duality

► For  $\mathfrak{sl}_2(\mathbb{C})$  these can be **classified**: we only have **three** classes on  $\mathbb{Z}$

## Verma Howe duality

---

$\mathfrak{sl}_3$ :

- 
- ▶ For higher rank these are **grid-type** modules; **generic scalars**  $\Rightarrow$  simple
  - ▶ **Fernando, Futorny ~1986** All simple weight modules are dense or are induced from dense modules

Dense modules = “biggest possible” weight modules

▶ Although the simple dense modules are essentially classified (**Mathieu ~2000**)  
▶ they still are mostly mysterious

induced from dense modules

# Verma Howe duality

(a) There are commuting actions

$$U(\mathfrak{gl}_2) \curvearrowright \Delta^{\oplus \lambda} = \bigoplus_{d \in \mathbb{Z}^n} \Delta^{\lambda_1+d_1} \otimes \dots \otimes \Delta^{\lambda_n+d_n} \curvearrowright U(\mathfrak{gl}_n).$$

**Commuting actions**

(b) Let  $\phi^k$  be the algebra homomorphism induced by the  $U(\mathfrak{gl}_k)$  actions from (a). Then, for admissible parameters  $\lambda$ :

$$\phi^2: U(\mathfrak{gl}_2) \rightarrow_d \text{End}_{U(\mathfrak{gl}_n)}(\Delta^{\oplus \lambda}), \quad \phi^n: U(\mathfrak{gl}_n) \rightarrow_d \text{End}_{U(\mathfrak{gl}_2)}(\Delta^{\oplus \lambda}).$$

**Double centralizer**

That is, the two actions densely-generate the others centralizer.

(c) For admissible parameters  $\lambda$  we have the decomposition of the  $U(\mathfrak{gl}_2)$ - $U(\mathfrak{gl}_n)$  bimodule  $\Delta^\lambda$  into

$$\Delta^{\oplus \lambda} \cong \bigoplus_{\substack{g \in \mathbb{Z} \\ t \in \mathbb{Z}_{\geq 0}}} \Delta^{\Sigma \lambda_n + g - t, t} \otimes D^{g-t, t}.$$

**Bimodule decomp.**

**Verma**

**Dense**

The various  $\Delta^{\Sigma \lambda_n + g - t, t}$  and  $D^{g-t, t}$  are nonisomorphic simple  $U(\mathfrak{gl}_2)$  modules respectively  $U(\mathfrak{gl}_n)$  modules.

► The above is **Verma Howe duality**

► **Admissible parameters**  $\Leftrightarrow$  generic/transcendental

## Verma Howe duality

---

(a) There are commuting actions

$$U(\mathfrak{gl}_2) \curvearrowright \Delta^{\oplus \lambda} = \bigoplus_{d \in \mathbb{Z}^n} \Delta^{\lambda_1+d_1} \otimes \dots \otimes \Delta^{\lambda_n+d_n} \curvearrowright U(\mathfrak{gl}_n).$$

**Braid action**

(b) Let  $\phi^k$  be the algebra homomorphism induced by the  $U(\mathfrak{gl}_k)$  actions from (a). Then, for admissible parameters  $\lambda$ :

$$\phi^2: U(\mathfrak{gl}_2) \rightarrow_d \text{End}_{U(\mathfrak{gl}_n)}(\Delta^{\oplus \lambda}), \quad \phi^n: U(\mathfrak{gl}_n) \rightarrow_d \text{End}_{U(\mathfrak{gl}_2)}(\Delta^{\oplus \lambda}).$$

That is, the two actions densely-generate the others centralizer.

(c) For admissible parameters  $\lambda$  we have the decomposition of the  $U(\mathfrak{gl}_2)$ - $U(\mathfrak{gl}_n)$  bimodule  $\Delta^\lambda$  into

$$\Delta^{\oplus \lambda} \cong \bigoplus_{\substack{g \in \mathbb{Z} \\ t \in \mathbb{Z}_{\geq 0}}} \Delta^{\Sigma \lambda_n + g - t, t} \otimes D^{g-t, t}.$$

The various  $\Delta^{\Sigma \lambda_n + g - t, t}$  and  $D^{g-t, t}$  are nonisomorphic simple  $U(\mathfrak{gl}_2)$  modules respectively  $U(\mathfrak{gl}_n)$  modules.

---

- ▶ Moreover, there is a **surjective braid group action** on the marked part
- ▶ All higher LKB reps shows up **infinitely many times**
- ▶ This “immediately” implies that all higher LKB reps are simple

# Verma Howe duality

---

(a) *There are commuting actions*

$$U(\mathfrak{gl}_2) \circlearrowleft \Delta^{\oplus \lambda} = \bigoplus_{d \in \mathbb{Z}^n} \Delta^{\lambda_1+d_1} \otimes \dots \otimes \Delta^{\lambda_n+d_n} \circlearrowright U(\mathfrak{gl}_n).$$

(b) *Let  $\phi^k$  be the algebra homomorphism induced by the  $U(\mathfrak{gl}_k)$  actions from (a). Then, for admissible parameters  $\lambda$ :*
