#### Definition

The least cardinal of a generating set for a free ultrafilter on  $\omega$  is denoted by  $\mathfrak{u}$ .

#### Definition

The least cardinal of a filter  $\mathcal{F}$  on  $\omega$  such that there is no infinite  $X \subseteq \omega$  such that  $X \subseteq^* A$  — in other words,  $X \setminus A$  is finite — for all  $A \in \mathcal{F}$  is denoted by  $\mathfrak{p}$ .

### THEOREM (BELL)

The least cardinal  $\kappa$  for which  $MA_{\kappa}(\sigma$ -centred) fails is equal to  $\mathfrak{p}$ .

The **Key Hypothesis** is the following: There is a generating set  $\{G_{\xi}\}_{\xi \in \kappa}$  for an ultrafilter on  $\omega$  such that there exist infinite  $A_{\xi} \subseteq \omega$  satisfying:

- $A_{\xi} \subseteq^* G_{\eta}$  for each  $\eta \leq \xi$
- $A_{\xi} \cap A_{\eta}$  is finite if  $\xi \neq \eta$ .

#### Lemma

If  $\mathfrak{p} = \mathfrak{u}$  then the Key Hypothesis is satisfied.

→ ■ ▶ → ヨ ▶ → ヨ ▶

To see this, let  $\{G_{\xi}\}_{\xi \in \mathfrak{u}}$  generate an ultrafilter  $\mathcal{F}$ . Choose inductively for each  $\xi \in \mathfrak{u}$  an infinite set  $A_{\xi} \notin \mathcal{F}$  such that

• 
$$oldsymbol{A}_{\xi} \subseteq^{*} oldsymbol{G}_{\eta}$$
 for each  $\eta \leq \xi$ 

•  $A_{\xi} \cap A_{\eta}$  is finite if  $\xi > \eta$ .

This can be done because  $\{G_{\xi}\} \cup \{G_{\eta}, \omega \setminus A_{\eta}\}_{\eta \in \xi}$  generates a filter and  $\xi < \mathfrak{p}$ .

#### COROLLARY

If  $\mathfrak{p} = \mathfrak{c}$  or  $\mathfrak{u} = \aleph_1$  then the Key Hypothesis holds.

It will follow from the results of Lecture III that the Key Hypothesis fails in the model obtained by adding  $\aleph_2$  Cohen reals to a model of CH.

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Given the Key Hypothesis, it can be assumed that  $A_{\xi} \subseteq G_{\xi}$  rather than just  $A_{\xi} \subseteq^* G_{\xi}$  for each  $\xi \in \kappa$ . Let  $A_{\xi}$  be enumerated by  $\omega \times \omega$  — in other words,  $A_{\xi} = \{a_{\xi}(i,j)\}_{(i,j)\in\omega\times\omega}$ . Let  $\omega \setminus G_{\xi}$  be enumerated by  $\{a_{\xi}(-1,j)\}_{j\in\omega}$ . Now define permutations  $\theta_{\xi,i}$ , for  $i \geq -1$ , as follows:

$$\theta_{\xi,i}(x) = \begin{cases} a_{\xi}(i+1,j) & \text{if } x = a_{\xi}(i,j) \\ a_{\xi}(i,j) & \text{if } x = a_{\xi}(i+1,j) \\ x & \text{otherwise} \end{cases}$$

Note that each  $\theta_{\xi,i}$  is an involution sending  $A_{\xi,i}$  to  $A_{\xi,i+1}$  and the  $A_{\xi,i}$  are pairwise disjoint where  $A_{\xi,i} = \{a_{\xi}(i,j)\}_{j \in \omega}$ . Let  $\mathbb{G}$  be the subgroup of  $\mathbb{S}(\omega)$  generated by  $\{\theta_{\xi,i}\}_{\xi \in \kappa, i \geq -1}$ .

イロト イポト イヨト イヨト 二日

The first thing to notice is that each element of  $\mathbb{G}$  preserves the ultrafilter  $\mathcal{F}$  generated by  $\{G_{\xi}\}_{\xi \in \kappa}$  — in other words, if  $\mu_{\mathcal{F}}(X) = 1$  if and only if  $X \in \mathcal{F}$  then  $\mu_{\mathcal{F}}$  is an invariant mean for the natural action of  $\mathbb{G}$  on  $\omega$ .

Moreover,  $\mu_{\mathcal{F}}$  is unique. To see this, suppose that  $\nu$  is another invariant mean on  $\omega$ . There must be some  $\xi$  such that  $\nu(\omega \setminus G_{\xi}) > 0$  and let  $k > \nu(\omega \setminus G_{\xi})$ . Recall that  $A_{\xi,-1} = \omega \setminus G_{\xi}$  and  $A_{\xi,i} = \{a_{\xi}(i,j)\}_{j \in \omega}$  for  $i \geq 0$  and, hence,  $\theta_{\xi,i}(A_{\xi},i) = A_{\xi,i+1}$  when  $-1 \leq i < k$ . Moreover  $A_{\xi,i} \cap A_{\xi,i'} = \emptyset$  if  $i \neq i'$ .

The invariance of  $\nu$  under  $\mathbb{G}$  then implies that  $\nu(\bigcup_{i=-1}^{k} A_{\xi,i}) = (k+2)\nu(\omega \setminus G_{\xi}) > 1$  contradicting that  $\nu$  is a probability measure.

The fact that  $\mathbb{G}$  is amenable will be established by showing that it satisfies the much stronger property of being locally finite. The Key Hypothesis will be crucial for the argument.

#### Definition

If  $\sigma \in \mathbb{S}(\omega)$  then the support of  $\sigma$  is defined to be  $\{n \in \omega \mid \sigma(n) \neq n\}$ . If  $H \subseteq \mathbb{S}(\omega)$  then the support of H is defined to be the union of the supports of its elements.

#### Lemma

A finite subset  $H \subseteq \mathbb{S}(\omega)$  generates a finite group H' if and only if there is a uniform bound for the size of the orbits  $O_{H'}(\{n\})$  of n under H'.

To see this, note first that  $|H'| \ge |O_{H'}(\{n\})|$  for each  $n \in \omega$ .

For the other direction suppose that  $M \ge |O_{H'}(\{n\})|$  for each  $n \in \omega$  and let  $\{W_n\}_{n \in \omega}$  list all the distinct orbits of H'. Let  $D_m = \{i \in \omega \mid |W_i| = m\}$  and for each  $i \in D_m$  let  $W_i = \{w_{i,j}\}_{j \in m}$ . For  $h \in H$  let

$$\Phi_h: D_m \to \mathbb{S}(m)$$

be defined by  $\Phi_h(i)(j) = k$  if and only if  $h(w_{i,j}) = w_{i,k}$ . Note that there is a partition

$$D_m = \bigcup \left\{ D_m^{\phi} \mid \phi : H \to \mathbb{S}(m) \right\}$$

such that  $\Phi_h(j) = \phi(h)$  for each h and  $j \in D_m^{\phi}$ .

(지원) 지금이 지금이 문

Let  $H_m^{\phi}$  be the subgroup of  $\mathbb{S}(m)$  generated by  $\{\phi(h) \mid h \in H\}$ . It suffices to observe that H' is isomorphic to

## $\prod_{m \leq J} \prod_{\phi: H \to \mathbb{S}(m)} H_m^{\phi}$

and that this is a finite group.

▲ □ ► ▲ □ ► ▲

#### Lemma

Let  $\theta$  be an involution that sends A to B and B to A and fixes all else. If  $H \subseteq \mathbb{S}(\omega)$  is a subgroup whose support is almost disjoint from A then  $H \cup \{\theta\}$  generates a finite group.

To begin note that there is no loss of generality in assuming that the support of H is actually disjoint from A. To see this let Z be the orbit under H of the intersection of A with the support of H. This is finite and  $H = H_Z \times H_{\omega \setminus Z}$  where  $H_X = \{h \upharpoonright X \mid h \in H\}$ . The support of  $H_{\omega \setminus Z}$  is actually disjoint from A. Since  $H_Z$  consists only of permutations with finite support it follows that the group generated by  $H \cup \{\theta\}$  is finite if and only if the group generated by  $H_{\omega \setminus Z} \cup \{\theta\}$  is finite.

< ロ > < 同 > < 回 > < 三 > < 三

The argument will rely on showing that there is a uniform bound for  $|O_{H \cup \{\theta\}}(\{n\})|$ . To see that this is the case, it suffices to show that for any such *n*, if *f* is in the group generated by  $H \cup \{\theta\}$  then f(n) is equal to one of:

- θhθ(n)
- hθ(n)
- θh(n)
- or *h*(*n*)

where  $h \in H$ . The reason this suffices is that there is a uniform bound for  $O_H(\{n\})$  and adding  $\theta$  will, at most, increase the size by a factor of 4.

(4 冊 ト 4 三 ト 4 三 ト

An arbitrary element f of the group generated by  $H \cup \{\theta\}$  looks like

$$f = \theta^{n_0} h_0 \theta^{n_1} h_1 \dots \theta^{n_k} h_k \theta^{n_{k+1}}$$

and, keeping in mind that  $\boldsymbol{\theta}$  is an involution, one of the following alternatives holds

 $f = \theta h_0 \theta h_1 \dots \theta h_k \theta$  $f = \theta h_0 \theta h_1 \dots \theta h_k$  $f = h_0 \theta h_1 \dots \theta h_k \theta$  $f = h_0 \theta h_1 \dots \theta h_k \theta$ 

All that needs to be checked now is that if  $h_0$  and  $h_1$  belong to H then...

イロト イポト イヨト イヨト

...  $h_0 \theta h_1(n)$  is equal to one of the following:

- $h_0\theta(n)$
- $h_0 h_1(n)$
- $\theta h_1(n)$ .

To see this, first suppose that  $h_1(n) = n$ . Then  $h_0\theta h_1(n) = h_0\theta(n)$ .

Otherwise, it must be that  $h_1(n)$  is in the support of H and there are two possibilities The first is that  $h_1(n)$  is not in the support of  $\theta$ . In this case  $h_0\theta h_1(n) = h_0h_1(n)$ . Otherwise, because the support of  $\theta$  is  $A \cup B$  and A is disjoint from the support of H it must be that.  $h_1(n) \in B$ . Since  $\theta$  sends B to A it follows that  $\theta(h_1(n)) \in A$  and hence is not in the support of  $h_0$ . Therefore  $h_0\theta h_1(n) = \theta h_1(n)$ .

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・

To finish the proof that  $\mathbb{G}$  is locally finite it suffices to show that any finite set of generators of  $\mathbb{G}$  generates a finite group. Recall that the Key Hypothesis provided a generating set  $\{G_{\xi}\}_{\xi \in \kappa}$  for an ultrafilter on  $\omega$  and infinite  $A_{\xi} \subseteq \omega$  satisfying:

- $A_{\xi} \subseteq^* G_{\eta}$  for each  $\eta \leq \xi$
- $A_{\xi} \cap A_{\eta}$  is finite if  $\xi \neq \eta$ .

and that this yields involutions  $\theta_{\xi,-1}$  from  $\omega \setminus G_{\xi}$  to a subset of  $A_{\xi}$ and  $\theta_{\xi,i} : A_{\xi,i} \to A_{\xi,i+1}$  such that the  $A_{\xi,i}$  are pairwise disjoint. Proceed by induction on the size of  $H \subseteq \mathbb{G}$  to show that Hgenerates a finite set. When |H| = 1 use that the generators are involutions.

Supposing the result is true for H of size n let |H| = n + 1 and let  $\xi$  be the largest ordinal such that there is some j such that  $\theta_{\xi,j} \in H$ . Let J be the largest integer such that  $\theta_{\xi,J} \in H$ . It follows that  $A_{\xi,J+1}$  is almost disjoint from the support of the group generated by  $H \setminus \{\theta_{\xi,J}\}$ . Since  $\theta_{\xi,J}$  is an involution the preceding lemma implies that the group generated by  $\theta_{\xi,J}$  and  $H \setminus \{\theta_{\xi,J}\}$  is finite.

イロト イポト イヨト イヨト

#### QUESTION

Is it possible to strengthen locally finite to some other condition?

Abelian is not possible. Rosenblatt and Talagrand showed that no nilpotent subgroup of  $\mathbb{S}(\omega)$  acts with a unique mean and this was improved by Krasa to show that there is no solvable subgroup of  $\mathbb{S}(\omega)$  acts with a unique mean.

No countable subgroup of  $\mathbb{S}(\omega)$  acts with a unique mean and assuming MA there is no such group of cardinality less than  $2^{\aleph_0}$ .
