

## GRADUATE SEMINAR ON ADVANCED TOPOLOGY (S4D4)

**Higher Algebra**

Tuesdays, 14:15, N 0.007

Two of the most salient features of singular cohomology are its multiplicative structure and the Steenrod operations. From the point of view of modern homotopy theory, these are shadows of a so-called  $E_\infty$  *ring structure* on the spectrum  $H\mathbb{Z}$  representing singular cohomology. There are many other examples of  $E_\infty$  rings, arising from geometry (e.g. topological  $K$ -theory or bordism) or algebra and category theory (algebraic  $K$ -theory, Hochschild homology, etc.).

In this seminar, we will build up the language for  $E_\infty$  ring spectra and their  $\infty$ -categories of modules, and then discuss analogues of some subjects of classical algebra, such as Morita theory and deformation theory, in this new higher algebraic context.

**Prerequisites.** We assume that all participants are familiar with the foundations of  $\infty$ -categories, and in particular with their model in terms of quasi-categories.

**Note.** In many cases, the references contain more material than you will be able to present in your talk, and you should decide on which parts you want to focus (apart from the results explicitly mentioned in the talk description below, of course). You should moreover meet with the assistant (Tobias Lenz, [lenz@math.uni-bonn.de](mailto:lenz@math.uni-bonn.de)) at least two weeks before your talk to go through the material you want to present and to discuss any questions you might have.

**Talks**

1. **Presentable and stable  $\infty$ -categories:** P. Kupffer ..... October 14, 2025  
 Define accessible and presentable  $\infty$ -categories, show that the  $\infty$ -category  $\mathrm{Spc}$  of spaces is presentable, and introduce the  $\infty$ -categories  $\mathrm{Pr}^L$  and  $\mathrm{Pr}^R$ . Afterwards, state the Adjoint Functor Theorem for presentable  $\infty$ -categories [Lur09, §5.4–5.5].  
 Discuss the various equivalent definitions of stable  $\infty$ -categories [Lur17, §1.1] and introduce the stabilization of  $\infty$ -categories with finite limits [Lur17, §1.4.1]. Show that the stabilization of a presentable category is presentable again [Lur09, Prop. 1.4.4.4], and define the  $\infty$ -category  $\mathrm{Sp}$  of spectra as the stabilization of  $\mathrm{Spc}$ . Deduce its universal property [Lur17, Cor. 1.4.4.6].
2. **Stable  $\infty$ -categories and t-structures:** G. Rajkowski ..... October 21, 2025  
 Introduce the notion of a t-structure on a stable  $\infty$ -category [Lur17, Def. 1.2.1.1], derive its basic properties, and define what it means for a t-structure to be accessible [Lur17, Def. 1.4.4.12] or left/right complete [Lur17, Rmk. 1.2.1.12]. Introduce the standard t-structures on  $\mathrm{Sp}$  [Lur17, Prop. 1.4.3.4] and on the derived category  $D(R)$  of a (discrete) ring  $R$  [Lur17, Prop. 1.3.2.19].
3. **Symmetric monoidal  $\infty$ -categories:** O. Niezhenskyi ..... October 28, 2025  
 Describe the formulation of symmetric monoidal 1-categories in terms of cocartesian fibrations (‘Grothendieck op-fibrations’) over  $\mathrm{Fin}_*$  [Lur17, beginning of Chapter 2] and introduce symmetric monoidal  $\infty$ -categories [Lur17, Def. 2.0.0.7]. Discuss cartesian and cocartesian symmetric monoidal structures [Lur17, §2.4.1, §2.4.3] and nerves of symmetric monoidal model categories [NS18, Thm. A.7].
4. **Classical operads:** M. Xia ..... November 4, 2025  
 Motivate operads with the Stasheff associahedra and the Recognition Theorem for (1-fold) loop spaces [Sta63]. Define operads in a symmetric monoidal 1-category as well as their algebras and modules over operadic algebras. Give many examples, and in particular introduce the little cubes operads and talk about the recognition theorem for iterated loop

spaces [May72]. Mention colored operads (aka multicategories) as a generalization of operads.

As the starting point of your talk you should use [Lur17, §2.2.1], but you may want to consult other textbooks on operads as well.

5. **Algebras and modules over  $\infty$ -operads:** D. Unge ..... November 11, 2025  
 Define  $\infty$ -operads as well as their algebras and the corresponding notion of modules [Lur17, §2.1 and §3.3]. Discuss the relation to operadic algebras on the pointset level [Lur17, §4.1.8 and §4.5.4]. Finally, give an overview of the proof of [Lur17, Thm. 3.4.4.2].
6. **The Lurie tensor product:** D. Arone ..... November 18, 2025  
 Define the tensor products of  $\infty$ -categories with certain colimits [Lur17, §4.8.1] and how this gives a tensor product on  $\mathrm{Pr}^{\mathrm{L}}$ . Use this to show that  $\mathrm{Sp}$  admits a unique presentably symmetric monoidal structure with unit given by the sphere spectrum  $\mathbb{S}$  [Lur17, §4.8.2].
7. **Day convolution:** J. Zhang ..... November 25, 2025  
 Introduce Day convolution and its universal property following [Lur17, §2.2.6] (paying special attention to the symmetric monoidal case). Afterwards, discuss the additional universal property for Day convolution on presheaf categories [Lur17, 4.8.1.10–13] and use this to show that presentably symmetric monoidal  $\infty$ -categories have presentations [NS17, Prop. 2.2].  
 If you have time left, discuss the (localized) Day convolution structure on  $\mathrm{CMon}(\mathrm{Spc})$  in analogy with [CHLL25, Cor. 3.3.5] (the ‘Lydakis smash product’) and use this to give a multiplicative refinement of the Recognition Theorem for connective spectra [GGN15].
8. **Structured ring spectra:** J. Martín ..... December 2, 2025  
 Define  $E_1$  rings and  $E_\infty$  rings [Lur17, Def.s 4.1.1.6 and 7.1.0.1]. Give many examples, in particular the sphere, spherical monoid rings, and Eilenberg–Mac Lane spectra [Lur17, Prop. 7.1.3.18], and discuss general constructions like completions [Lur18, Cor. 7.3.5.2] and localizations [Lur17, Prop. 7.2.3.27].
9. **Modules over ring spectra:** N. Ouagnar ..... December 9, 2025  
 Define the  $\infty$ -category  $\mathrm{LMod}_R$  of modules over an  $E_1$  ring  $R$ , show that it is stable, and introduce its standard t-structure [Lur17, §7.1.1]. Show that  $\mathrm{LMod}_R$  for an  $E_\infty$  ring  $R$  has a preferred symmetric monoidal structure, and discuss how for connective  $R$  the standard t-structure yields truncations and connective covers on  $\mathrm{Alg}_R$  and  $\mathrm{CAlg}_R$  [Lur17, §7.1.3].
10. **Morita theory:** G. Ong ..... December 16, 2025  
 Prove the  $\infty$ -categorical Schwede–Shipley Theorem [Lur17, Thm. 7.1.2.1] as well as [Lur17, Prop. 7.1.2.7]. Discuss many examples, in particular the equivalence  $D(R) \simeq \mathrm{LMod}_{HR}(\mathrm{Sp})$  for a discrete commutative ring  $R$  and the algebraic model for rational spectra [Lur17, Thm. 7.1.2.13].
11. **The cotangent complex I: General Theory:** I. Radu-Alexandru ..... January 13, 2026  
 Define the tangent bundle of a presentable  $\infty$ -category [Lur17, Def. 7.3.1.9], relative adjunctions [Lur17, Def. 7.3.2.2], and the relative cotangent complex functor [Lur17, Def. 7.3.3.1]. Discuss the proof of [Lur17, Thm.s 7.3.4.13 and 7.3.4.18], paying special attention to the commutative case.
12. **The cotangent complex II: Kähler differentials:** S. Brinkerhoff ..... January 20, 2026  
 Specialize the discussion from last week to the case of  $E_\infty$  rings. Discuss square-zero extensions, leading to the fact that the Postnikov tower of an  $E_\infty$  ring is comprised of square-zero extensions [Lur17, §7.4.1]. Prove the basic finiteness and connectivity properties as well as the relation to classical Kähler differentials [Lur17, §7.4.3].
